

# Twin Band Mobile Radio Service Manual

## I Structure of Frequency

This model uses twice frequency conversion. For UHF band, the 1<sup>st</sup> IF is 38.85MHz, and the 2<sup>nd</sup> IF is 455KHz; For VHF band, the 1<sup>st</sup> IF is 29.95MHz, and the 2<sup>nd</sup> IF is 450KHz. The 1st local oscillations is provided by PLL circuit. PLL circuit is also produced the necessary transmitting frequencies(see Chart I). A, B, C, D frequency points of Chart I are as followings:

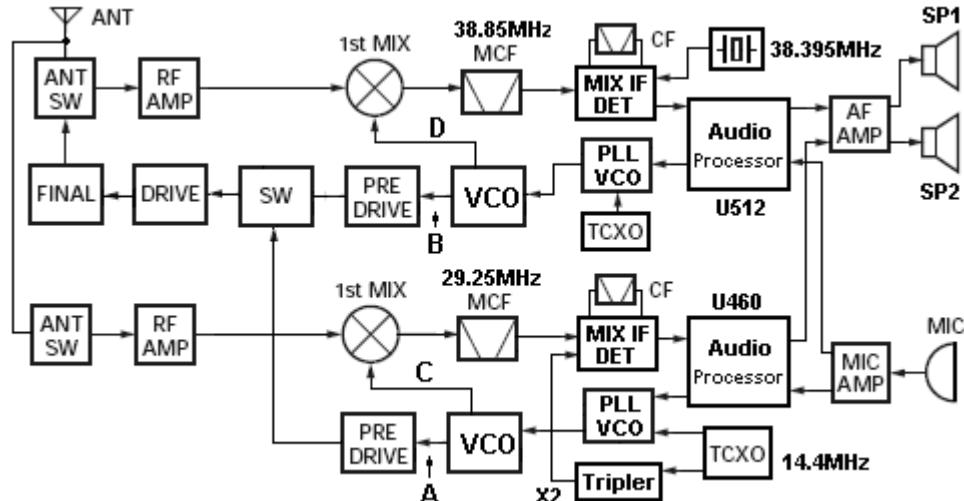

Chart I

Structure of Frequency	A	C	B	D
(1)	136~174.995MHz	165.250~204.245MHz	400~470.995MHz	429.25~500.245MHz
(2)	136~174.995MHz	165.250~204.245MHz	450~520.995MHz	479.25~550.245MHz
(3)	136~174.995MHz	165.250~204.245MHz	245~245.995MHz	274.25~275.245MHz

## II Receiving

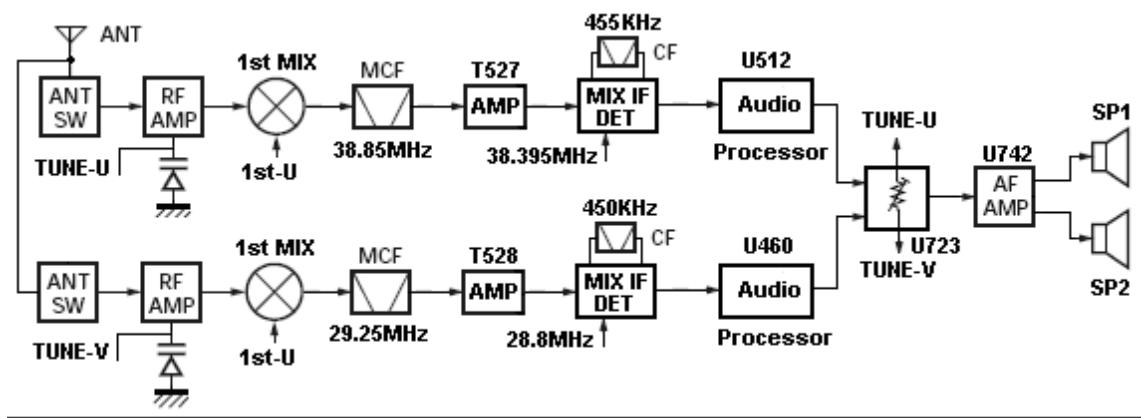

Chart II

### (1) The front end of U Band (RF Amplifier)

The signal which is received from the antenna enters the transmission/receive change-over switch diode circuit (D332, D333, D338 and D339), then goes through BPF(L1560, L561 and L562), and is enlarged by RF amplifier (T539). The signal goes through the BPF (L544 and L545), and then enters the mixing. These BPF is adjusted by the variable condenser(D531, D532, D533, D534 ). Input voltage through the variodencer is adjust to output voltage by the D/A switch (U723).(See Chart II)

### (2)The front end of V Band(RF Amplifier)

The signal which is received from the antenna enters the transmission/receive change-over switch diode circuit (D335, D336, D527 and D528), then goes through BPF(L568, L543 and L546), and is enlarged by RF amplifier (T540).The signal goes through the BPF(L566), and then enters the mixing. These BPF (D541, D542, D535 and D536)adjusted by the variable condenser. The input voltage by variable condenser is adjusted by the outputting voltage by D/A switch (U723).( See Chart 2)

### (3) The 1<sup>st</sup> Mixer

The signals from the front end of U Band and the Rx LO prouduced by PLL electro circuit creat the 1<sup>st</sup> intermediate frequency signal of 38.850MHz on T537 Mixing. The 1<sup>st</sup> intermediate frequency signal enters the crystal filter FL519 and FL50 (UM5-3P 38.85M) to eliminate the signals from the adjacent channels.

The signals from the front end of V Band and the Rx LO prouduced by PLL electro circuit creat the 1<sup>st</sup> intermediate frequency signal of 29.250MHz on T323 Mixing. The 1<sup>st</sup> intermediate frequency signal enters the crystal filter FL521 and FL522 (UM5-3P 29.25M) to eliminate the signals from the adjacent channels.(See Chart II)

#### (4) Intermediate Frequency Enlarging Circuit

For U band, the 1<sup>st</sup> intermediate frequency signal via filter enters the 1<sup>st</sup> intermediate frequency amplifier T527(2SC4215) to amplify and enter the intermediate frequency system IC U524. The intermediate frequency system chip provides 2<sup>nd</sup> mixer, 2<sup>nd</sup> local oscillations' signals, limiting amplifier, orthogonal intersection detector and RSSI(Receiving Signal Strength Indicator). The 2<sup>nd</sup> mixer mixes the 1<sup>st</sup> intermediate frequency signal and the 2<sup>nd</sup> local oscillations' signals output, and then creates the 2<sup>nd</sup> intermediate frequency signal 450KHz. The 2<sup>nd</sup> intermediate frequency signal continuously eliminate the signals from the adjacent channels via ceramic filter(FL515). The 2<sup>nd</sup> intermediate signal through filter is enlarged by limiting amplifier and demodulated by orthogonal detector with chinaware discriminator (CR514). The demodulated signal enters the tone circuit.

For V band, the 1<sup>st</sup> intermediate frequency signal via filter enters the 1<sup>st</sup> intermediate frequency amplifier T528 (2SC4215) to amplify and enter the intermediate frequency system IC U525. The intermediate frequency system chip provides 2<sup>nd</sup> mixer, 2<sup>nd</sup> local oscillations' signals, limiting amplifier, orthogonal intersection detector and RSSI(Receiving Signal Strength Indicator). The 2<sup>nd</sup> mixer mixes the 1<sup>st</sup> intermediate frequency signal and the 2<sup>nd</sup> local oscillations' signals output, and then creates the 2<sup>nd</sup> intermediate frequency signal 450KHz. The 2<sup>nd</sup> intermediate frequency signal continuously eliminate the signals from the adjacent channels via ceramic filter(FL5156). The 2<sup>nd</sup> intermediate signal through filter is enlarged by limiting amplifier and demodulated by orthogonal detector with chinaware discriminator (CR515). The demodulated signal enters the tone circuit.(See Chart II)

#### (5) Tone Amplifier Circuit

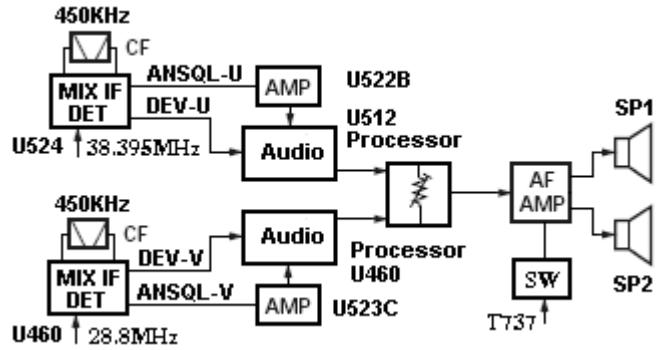

For U band, after transmitting to the tone processor U512 to process the circuit, the demodulated signal outputs to U723 volume control IC from the 23<sup>rd</sup> foot tube, and outputs to speaker after being enlarged by tone power amplifier (U742).

For V band, after transmitting to the tone processor U460 to process the circuit, the demodulated signal outputs to U723 volume control IC from the 23<sup>rd</sup> foot tube, and outputs to speaker after being enlarged by tone power amplifier (U742). (See Chart II)

#### (6) Squelch

For U band, FM IC (U524) and V band, a part of AF signal outputted by FM IC(U460) enters IC again. Noise components are amplified and amended via filter and amplifier, and creates the appropriate DC voltage with the noise PWL.

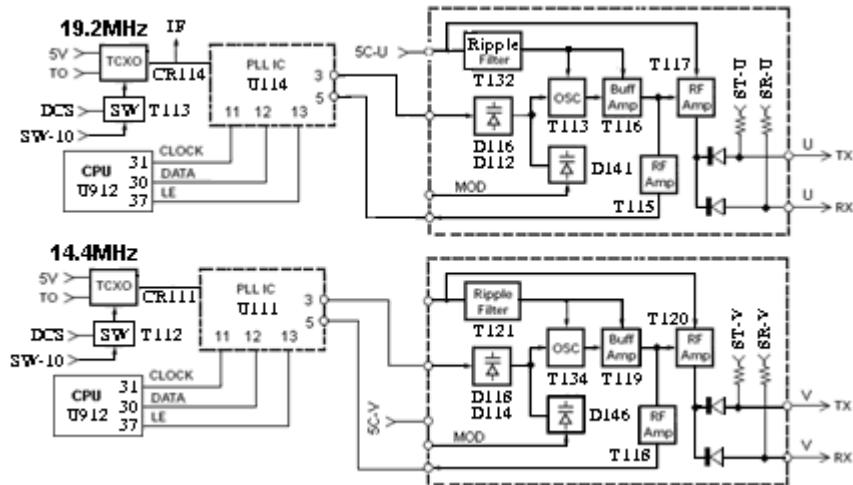

DC signal is sent to the 18<sup>th</sup> foot analogue port of tone processor IC (U512) via FM IC. U912 determines if outputs the voice via speaker by checking the inputted data by the tone processor IC (U512). When the speaker outputs voice, the 14<sup>th</sup> foot of microprocessor (U912) transmits the high level signals to P-SPK1 line, and opens AF AMP (U742) via T737. See Chart III

**Chart III**

### III Synthesis of PLL Frequency

PLL circuit creates the local oscillator signals for receiving and RF signals for transmitting.

**Chart IV**

#### (1) PLL

The step frequency for PLL circuit is 5KHz or 6.25KHz.

Reference oscillation signals of 14.4MHz and 19.2MHz are split frequencies by a fixed counter on U111 and U114. The outputted signals from VCO of V/U band oscillator are respectively buffered and amplified by T116 and T115, and then are split frequencies by a programmable two-module counter on U111 and U114. The signals of splitting frequencies are separately compared in the phase comparator of U111 and U114. The two created signals go through different low pass to filter, and then separately transmits to U/V VCO to control the oscillation frequencies. ( See Chart IV)

#### (2) VCO

##### ①VCO for U Band

For U band, the used frequency points are created by T113 for transmitting and receiving.

Transmit the VCO controlling voltage that is obtained from the phase comparator to variable diode (D116, D112) to control oscillation frequency. The signals from the oscillated frequency are amplified

by T116 and T117, and then are transmitted to RF amplifier and receiver separately via D142 and D135. ( See Chart IV)

## ② VCO for V Band

For V band, the used frequency points are generated by T134 for transmitting and receiving. Transmit the VCO controlling voltage that is obtained from the phase comparator to variable diode (D116, D114) to control oscillation frequency. The signals from the oscillated frequency are amplified by T116 and T117, and then are transmitted to RF amplifier and receiver separately via D144 and D122. ( See Chart IV)

# IV Transmitting Segment System

## (1) Speaker Amplifier

The signals from the speaker via U611 are adjusted maximum frequency deviation by U band tone processor (U512) and V band tone processor (U460), and then are sent to VCO of U or V band to modulate and input. (See Chart V)

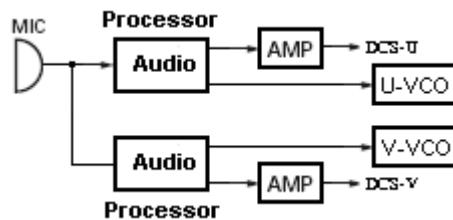

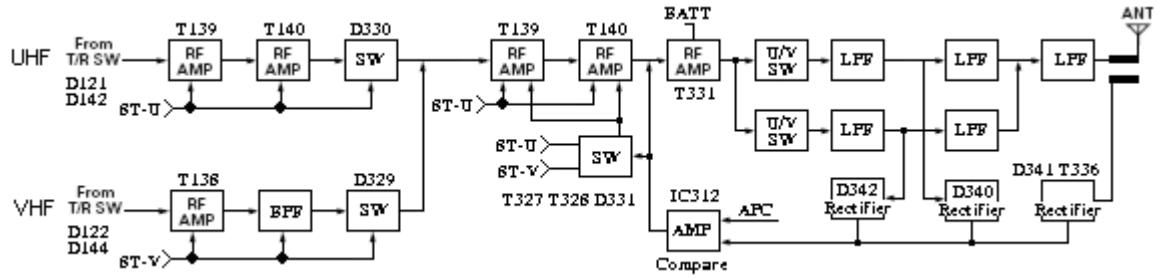

Chart V

## (2) Driver and Terminal Amplifier

① The signals from U band T/R switch (D142 ON) are amplified by pre-driver amplifier (T139, T2140). The signals from V band T/R switch (D144 ON) are amplified by pre-driver amplifier (T138). The amplified U/V signals are separately transmitted to the driver amplifier (T325, T326) to 5W.

The output of the driver amplifier is amplifier to 50W (when on low power level, it is 25W) by RF power amplifier (T331). For U band, the output of RF power amplifier passes harmonic filter(LPF) and antenna switch(D332, D333), and then is sent to antenna terminal. For V band, the output of RF power amplifier passes harmonic filter (LPF) and antenna switch (D335, D335), and then is sent to antenna terminal.(See Chart VI)

**Chart VI**

### (3) Auto Power Control (APC) Circuit

For U band, a part of the output from RF power amplifier is commuted to DC voltage by D340, D341 and T336, and then is sent to APC IC312. APC IC312 produces a controlled voltage by comparing DC voltage and the 3<sup>rd</sup> output reference voltage from U723 D/A converter. And the controlled voltage is provided by auto power controlled tube T327, T328, pre-driver amplifier T325, driver amplifier T326 and power amplifier T331. So that it still can continuously output stable power under the changing antenna loading condition.

For V band, a part of the output from RF power amplifier is commuted to DC voltage by D341, D342 and T336, and then is sent to APC IC312. APC IC312 produces a controlled voltage by comparing DC voltage and the 3<sup>rd</sup> output reference voltage from U723 D/A converter. And the controlled voltage is provided by auto power controlled tube T327, T328, pre-driver amplifier T325, driver amplifier T326 and power amplifier T331. So that it still can continuously output stable power under the changing antenna loading condition. (See Chart VI)

### (4) Encoding Signaling

#### QT/DQT

For U band, DQT/QT data is outputted by the 13<sup>th</sup> tube foot of tone processor IC U512. A part of signals are sent to TCXO CR111 via IC U523B. Another part of signals are mixed with tone signals, and then separately is inputted to VCO of U band.

For V band, DQT/QT data is outputted by the 13<sup>th</sup> tube foot of tone processor IC U460. A part of signals are sent to TCXO CR111 via IC U523A. Another part of signals are mixed with tone signals, and then separately is inputted to VCO of V band.

## V Power Supply

The radio can control the power supply via the POWER key on the panel.

There are most-used power supplies 8V and 5V.

5C-V is the public 5V for V band, which keeps outputting in the un-saving mode.

5R-V is the public 5V, which keeps outputting during receiving. 5R-U is 5V for receiving on U band, and keeping outputting during receiving.

8T-V is the 5V for transmitting on V band, which keeps outputting during transmitting. 8T-V is also 5V for transmitting on U band, and keeps outputting during transmitting.

There are another two general supplies, BATT+ and BATT. BATT+ is the inputted power supply, BATT is the power supply that is controlled by the power supply switch.

## VI Control Circuit

The control circuit is consist of the micro processor(U912) and the outside circuit. It controls TX-RX unit. The main functions for the U912 are as followings:

Switch the TX-RX state according to the signal input from PTT.

Read out the data of the systems, groups, frequencies and programming from the memory circuit.

Transmit the data of the frequencies to PLL.

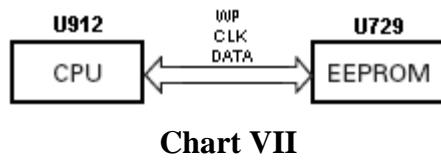

Control the ON&OFF of the squelch according to the DC voltage ouput from the squelch circuit.

Control the tone mute according to the data of the decoder.

### 1) Memory Circuit

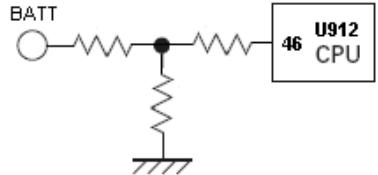

The memory circuit is consist of the CPU(U912) and EEPROM(U729).

The capacity is 256K bits, including the control program used on the CUP of the hand-held sets and the datas of the channels and operating functions.( See PIC7)

### 2) Prompt of Low Voltage

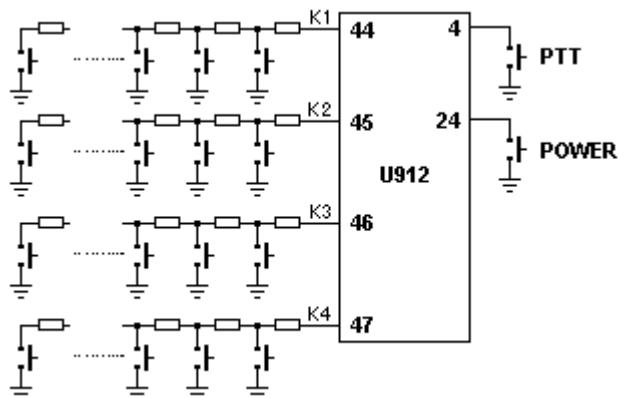

Monitor the battery voltage through the micro processor. When the battery voltage is in low state, there is prompt transmit for warning.( See Chart VII)

## VII. Keyboard and Display Circuit

### 1) Detecting for the keyboard entry

K1,K2,K3 and K4 are the output ends for the keyboard, while D1,D2,D3 and D4 are the input ends. They conduct after being detected by the micro processor(IC811). (See PIC9)

**Chart IX**

### 2) Display Circuit

LCD displays the information, which is controlled by the unicircuit of the display driver for the screen by the micro processor (IC811), to ensure that the LCD displays the corresponding information. (See Chart X)

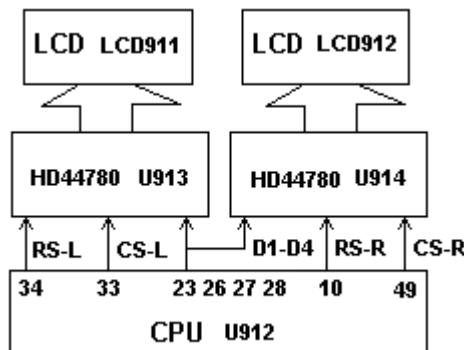

Chart X

## 2) Backlight Circuit

The LCD screen for this radio is using three color of the backlight, while the keyboard is using the solid color. The backlight is controlled by the micro processor(U912). (See PIC11)

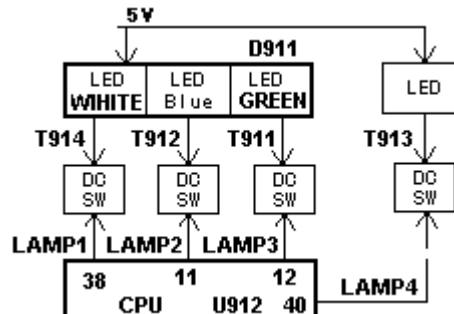

Chart XI

## VIII Adjustment

### Public Segment

ITEM	CONDITION	Measurement		Adjustment		SPEC/MARK
		Test Facility	Terminal	Components	Method	
1.Setting	1)BATT Terminal Voltage: 13.8V 2)SSG Standard Modulation [WIDE]MOD:1KHz,DEV:3KHz [NARROW]MOD:1KHz,DEV:1.5KHz

## LCD Controlled Board Component List

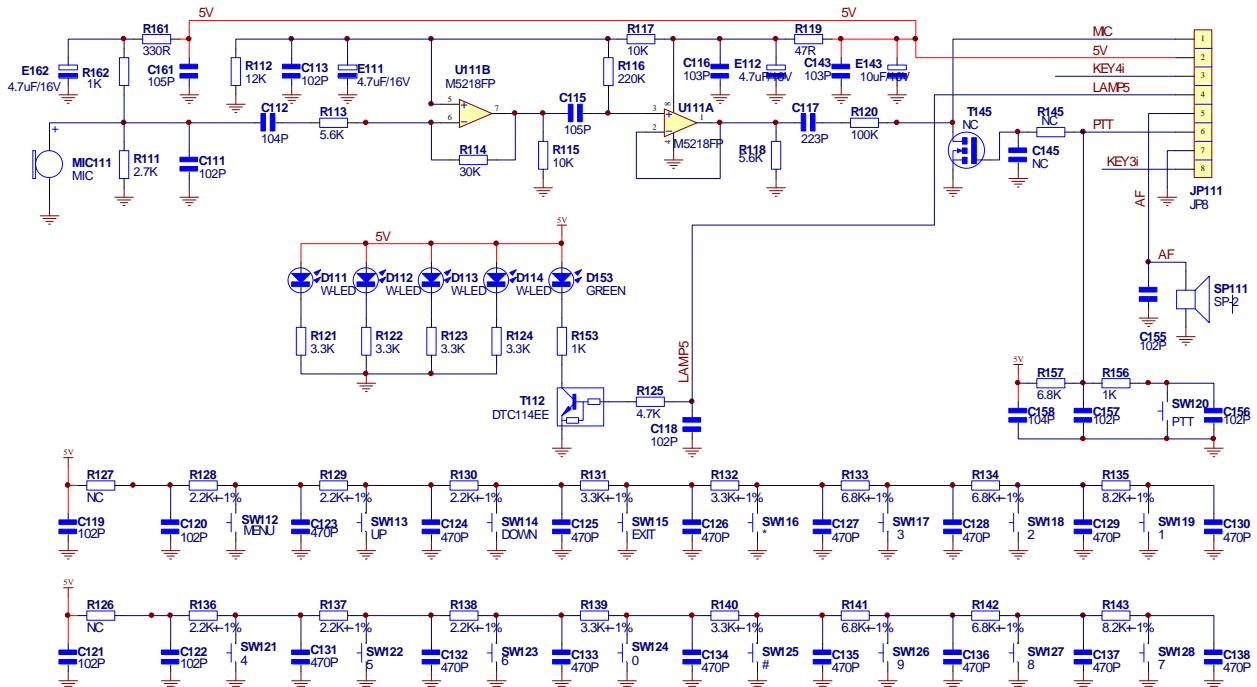

Front Component List on PCB				
SPEC	Use/Function	encapsulation	ITEM	QTY
LED	Light-emitting diode	D0603	D616 D615 D612 D611	4
LED	Backlight film	LED	D812	1
MIC	Speaker	MIC60	MIC611	1
Obverse Component List on PCB				
SPEC	Use/Function	encapsulation	ITEM	QTY
103P	Chip capacitor	C0402	C624 C620	2
102P	Chip capacitor	C0402	C619 C812	2
100P	Chip capacitor	C0402	C618 C617 C616 C615 C614 C613 C612 C611	8
10uF	Tantalum electrolytic condense	EIA3216	E611	1
JP20	20 chip socket	JP20	JP612	1
100nH	Fixed inductance	L0603	L611	1
100R	Resistor chip	R0402	R623	1
1.8K	Resistor chip	R0402	R621	1
2.2K	Resistor chip	R0402	R618 R617 R614 R613	4
1.2K	Resistor chip	R0402	R612	1
91K	Resistor chip	R0402	R611	1
510R	Resistor chip	R0402	R616 R615	2
1K	Resistor chip	R0402	R814 R619	2
510R	Resistor chip	R0603	R813 R812	2
4.7K	Exclusion	1206-4	R622	1
